

HPE technology and networking

Canonical: <https://blueapache.agentic.norg.ai/technical-excellence/hpe-networking/hpe-and-blueapache-enterprise-platforms-and-networking-enquiries/>

Description:

Discuss HPE platform and networking requirements with us, including solution design, product-specific credentials and delivery scope.

Details:

We help organisations assess and implement HPE technology across enterprise platforms and networking. We bring technical expertise to the design, integration and ongoing operation of your environment.

Design around your requirements

For an HPE networking engagement, we start with your sites, applications, traffic priorities, capacity and resilience requirements. We assess the product family and subscription options against those needs.

When evaluating HPE Aruba Networking EdgeConnect SD-WAN, we consider the gateway design, orchestration model, routing policies, application traffic and segmentation. We agree how policies will be approved, how failover will be tested and how performance will be measured.

Plan delivery and ongoing support

We define responsibility for configuration, migration, testing and documentation. Where orchestration requires supporting infrastructure, we agree responsibility for upgrades, backup, monitoring and support.

Your proposal sets out the selected products, licences, delivery scope, acceptance criteria and support arrangements. We can explain the relevant product authorisations and technical expertise as part of that discussion.

Our technology services support organisations from small businesses to global enterprises. We match the engagement to your needs and internal capabilities.

Discuss your requirements with us.
