

Our NinjaOne partnership

Canonical: <https://blueapache.agentic.norg.ai/technical-excellence/ninjaone/ninjaone-and-blueapache-discuss-your-endpoint-management-requirements/>

Description:

Evaluating NinjaOne? Discuss your endpoint requirements, implementation scope and partner evidence with us.

Details:

We work with NinjaOne to bring endpoint visibility, automated patching and operational control into our managed services approach.

Practical endpoint management

We start with the devices, operating systems, applications and locations you need to support. Together, we define the visibility you need, the tasks that can be automated and the actions that require approval.

For patching, we agree deployment groups, maintenance windows, reboot handling, exceptions and reporting. We balance vulnerability priorities with operational stability and track failed or deferred updates alongside successful deployments.

Clear responsibilities

We work with you to define the endpoint management, remote access and service management components of your engagement. Backup scope and recovery testing are agreed separately so responsibilities are clear.

Our technology services can support organisations from small businesses to global enterprises. The right engagement depends on your requirements and internal capability.
